

AlCaffe - Overall Application Aim

AlCaffe is an AI Model Marketplace - think of it as an "App Store for AI Models."

Core Concept:

- Instead of users needing separate accounts and API keys for OpenAI, Anthropic, Google, Mistral, etc., AlCaffe provides:
- One Platform, All AI Models - Access 50+ AI models from 22 providers (GPT-4, Claude, Gemini, Llama, DALL-E, Stable Diffusion, etc.) through a single interface
- Token-Based Economy - Users buy "AlCaffe Tokens" (ACT) once, then spend them across any model. The platform handles the billing complexity behind the scenes.
- Unified API - Developers get one API to access all models instead of integrating with each provider separately

Key Features:

- Model Comparison - Compare capabilities, pricing, speed across models
- Use Case Recommendations - "Best model for code generation" or "Best for image creation"
- Cost Transparency - See token costs before running queries
- Usage Analytics - Track spending across models
- News Aggregator - AI industry news feed

Business Model:

- Users buy tokens at a markup (platform takes ~20% margin)
- Platform pays providers (OpenAI, Anthropic, etc.) at wholesale rates
- Revenue = margin on token usage

Target Users:

- Developers wanting simplified AI integration
- Businesses comparing AI options
- Users who want to try multiple AI models without managing many account

It's essentially a unified gateway to the AI ecosystem.
